

We've taken the things you need most when starting out – Quality, Value and Performance – and combined them into a cost-effective solution for start-up pain practices.

QUALITY: Our refurbishment program is built around our key Performance Testing Process (PTP). We test all processes, controls and functions for X-Ray Beam and Alignment replacing defective components, cleaning the inside of chassis and replacing all filters.

VALUE: Pricing is always an issue when you're starting out. We've put together key essentials equipment and offer them to you at our lowest markup to ensure you are getting the best value and highest Return on Investment (ROI). In short, you will pay for the system in less than eight months with only a modest patient load. After that, it's pure profit so you can build up cash reserves and move to a newer model.

PERFORMANCE: We've chosen the **OEC 9400** for several reasons. It's a proven workhorse system and our refurbishment process adds years to its operating life. It delivers excellent images on **dual 17" monitors**, is powered by a **4.5 kW high frequency generator** and has all the features you're likely to need, including **image rotation, image gallery, last image hold, tri-mode 9"/6"/4.5" image intensifier, two pedal footswitch** and **black/white printer** for hard copy saves.
